# Part II; Drugs acting on enzyme (Antimetabolites)

### Antimetabolits: sites of drug action

### Antimetabolits: sites of drug action

## Antimetabolites

### General Characteristics:

- Antimetabolites are S phase-specific drugs that are structural analogues of essential metabolites and that interfere with DNA synthesis.
- Myelosuppression is the dose-limiting toxicity for all drugs in this class.

## Antimetabolite

- Pyrimidine Antagonists
  - Methotrexate, Fluorouracil, Floxuridine, Capecitabine
- Purine Antagonists
  - Mercaptopurine, Thioguanine
- DNA Polymerase/ DNA Chain Elongation Inhibitors
  - Cytarabine, Gemcitabine, Fludarabine, Cladribine, Clofarabine
- · Miscellaneous Antimetabolite
  - Hydroxyurea

# Pyrimidine Antagonist

- dTMP Synthesis Inhibitors
  - Direct inhibitor: Fluorouracil, Floxuridine,
     Tegafur.
  - Indirect inhibitors: Methotrexate

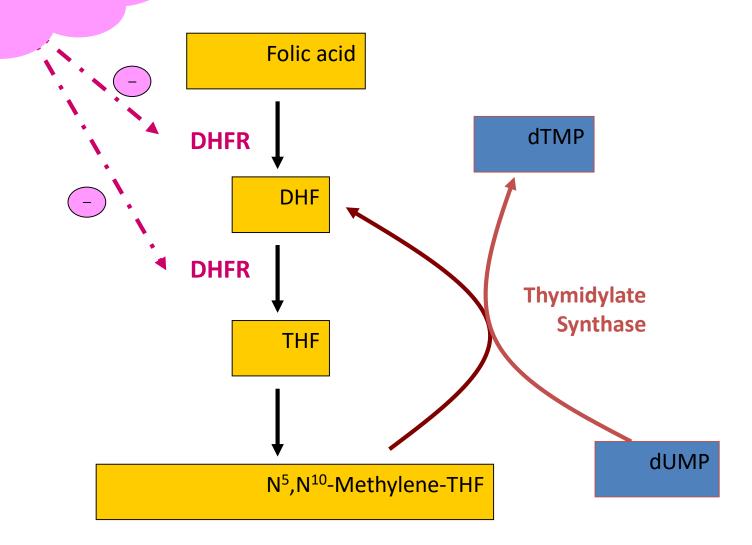

### Antimetabolites—Folic Acid Antagonist

#### Methotrexate (MTX)

#### Mechanism of Action:

The structures of MTX and folic acid are similar. MTX is actively transported into mammalian cells and inhibits dihydrofolate reductase, the enzyme that normally converts dietary folate to the tetrahydrofolate form required for thymidine and purine synthesis.

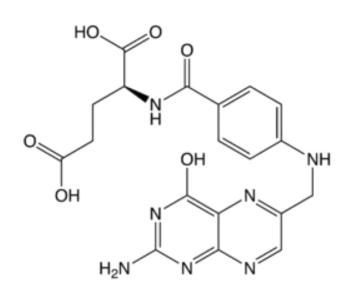

### Methotrexate

# Antimetabolites—— Folic Acid Antagonist

Methotrxate

L-(+)-N-[p[[2,4-diamino-6-pteridinyl]]methylamino]-benzoyl]-glutamic acid

Folic acid

## Methotrexate

7,8-Dihydrofolate (DHF)

#### DHFR ---- MTX -----DHF

Methotrexate (misorientated)

# Antimetabolites—— Folic Acid Antagonist

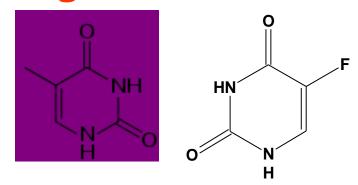

## Methotrexate (MTX)

### Adverse Effects:

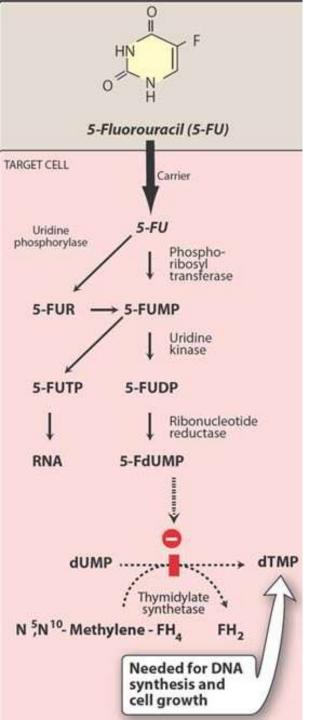

- MTX is myelosuppressive, producing severe leukopenia, bone marrow aplasia, and thrombocytopenia.
- This agent may produce severe gastrointestinal disturbances.
- Renal toxicity may occur because of precipitation (crystalluria) of the 7-OH metabolite of MTX.

# Antimetabolites—— Pyrimidine Antagonists

# 5-Fluorouracil (5-FU) Mechanism of Action:

 Fluorouracil is an analogue of thymine in which the methyl group is replaced by a fluorine atom. It has two active metabolites: 5-FdUMP and 5-FdUTP. 5-FdUMP inhibits thymidylate synthetases and prevents the synthesis of thymidine, a major building block of DNA. 5-FdUTP is incorporated into RNA by RNA polymerase and interferes with RNA function.

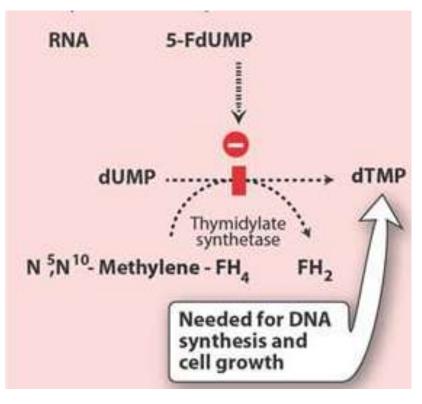

## 5-FU

Mechanism of the cytotoxic action of 5-FU

- 5-FU is converted to 5-FdUMP, which competes with deoxyuridine monophosphate (dUMP) for the enzyme thymidylate synthetase.
- 5-FU = 5-fluorouracil
- 5-FUR = 5-fluorouridine
- 5-FUMP = 5-fluorouridine monophosphate
- 5-FUDP = 5-fluorouridine diphosphate
- 5-FUTP = 5-fluorouridine triphosphate
- dUMP = deoxyuridine monophosphate
- dTMP = deoxythymidine monophosphate
- 5-FdUMP = 5-fluorodeoxyuridine monophosphate.

# Antimetabolites—— Pyrimidine Antagonists

5-Fluorouracil (5-FU)

Adverse Effects:

- Fluorouracil may cause nausea and vomiting, myelosuppression, and oral and gastrointestinal ulceration. Nausea and vomitting are usually mild.
- With fluorouracil, myelosuppression is more problematic after bolus injections, whereas mucosal damage is dose-limiting with continuous infusions.

deoxyribonucleotide form; 5-F-dUMP (active form)

Uracil (nucleic pirimidine base)

2. Floxuridine (fluoro deoxyuridine nucleoside prodrug)

HO-

 $HN_1$ 

-ÇH<sub>2</sub>

#### Antimetabolites— Pyrimidine Antagonists

3. Tetrahydrofuranyl derivative of uracil

> It is a prodrug slowly metabolized to 5-FU

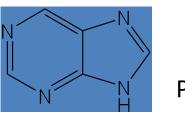

**Thymidine** 

**5-FU** 

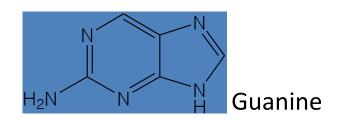

**URACIL** 18

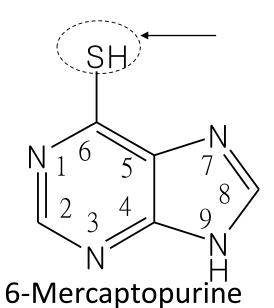

#### Antimetabolites—— *Purine Antagonists*

#### (Mercaptopurine, Thioguanine)

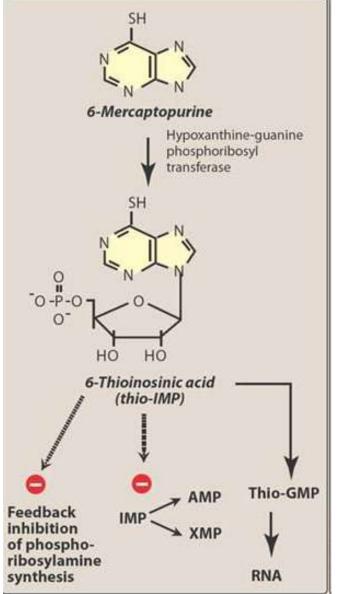

Purine

H<sub>2</sub>N N N H 6-Thioguanine

6-Mercaptopurine (6-MP) & Thioguanine

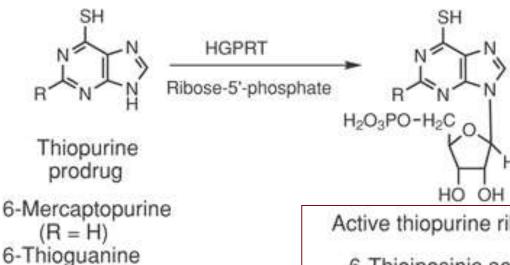

- Both 6-MP and Thioguanine are activated by HGPRT to toxic nucleotides that inhibit several enzymes involved in purine metabolism
- Cancer cells also fles alkaline phosphatase that inactivate toxic nucleotides

#### **Purines antagonists**

6-Mercaptopurine

#### Mode of action:

It inhibits purine biosynthesis as it replaces hypoxanthene, which is a natural intermediate in syntheses of nucleic acid purine bases.

**Metabolism generating** bioactive compounds

Active thiopurine ribonucleotide

- 6-Thioinosinic acid (R = H)
- 6-Thioguanylic acid (R = NH<sub>2</sub>)

TPMT SAM

"S-methylation"

TPMT SAM

**HGPRT** = hypoxanthine guanine • phosphoribosyl transferase

**TPMT = thiopurine methyl transferase** •

SAM = S-adenosylmethionine • (cofactor)

 $(R = NH_2)$ 

S-Methyl-6-mercaptopurine (R = H)(inactive)

S-Methyl-6-thioguanine (R = NH<sub>2</sub>)(inactive)

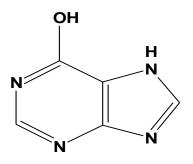

Active S-methythiopurine ribonucleotide (R= H)

HO

OH

#### Purines antagonists

6-mercaptopurine is rapidly metabolized by xanthene oxidase enzyme, which is responsible for oxidation of hypoxanthene and xanthene into uric acid. So when 6-mercaptopurine is co-administered with allopurinol (xanthine oxidase inhibitor) its half-life will be increased.

Hypoxanthene

**Allopurinol** 

# 6-MP & Allopurinol

- 6-MP is metabolized in the liver by xanthine oxidase and the inactive metabolites are excreted in the urine
- \*\*\*Allopurinol is used frequently to treat/prevent hyperuricemia caused by many anticancer drugs.
- If Allopurinol is used with 6-MP then the dose of 6-MP is reduced by more than 75%

6-Thiouric acid (inactive)

6-Thioxanthine (inactive)

## Antimetabolites—— Purine Antagonists

6-Mercapapurine (6-MP)

### **Indications:**

 Mercaptopurine is used primarily for the maintenance of remission in patients with acute lymphocytic leukemia and is given in combination with MTX for this purpose.

### Adverse Effects:

- Well tolerate.
- Myelosuppression is generally mild with thioguanine.Long-term mercaptopurine use may cause hepatotoxicity.

### Cytarabine and Gemcitabine

Cytarabine

$$T_{1/2} = 3.6 \text{ hrs}$$

Gemcitabine

$$T_{1/2} = 19 \text{ hrs}$$

Cytidine-base nucleosides

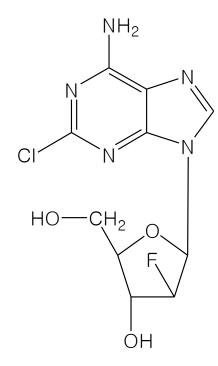

# Cytarabine Indications:

 Cytarabine has a narrow clinical spectrum and is primarily used in combination with daunorubicin or thioguanine for the treatment of acute nonlymphocytic leukemia.

### Adverse Effects:

 High doses of cytarabine can damage the liver, heart, and other organs.

### Fludarabine, Clabribine, and Clofarabine

Fludarabine phosphate

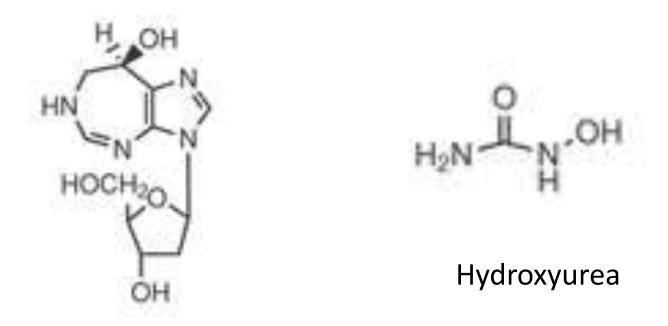

Cladribine

Clofarabine

2-Halogenated adenosine base nucleosides

### Miscellaneous Antimetabolites

Pentostatin and Hydroxyurea (self study)

**Pentostatin** 

# Miscellaneous Antimetabolites Hydroxyurea

- · Inhibits ribonucleotide reductase
  - Important in de novo DNA synthesis and DNA repair
- Orally bioavailable
