

Protein Synthesis Inhibitors

Part 1

Pharmacology 3
Dr. Heba Khader

بسم الله الرحمن الرحيم، اللهم لا سهل الا ما جعلته سهلا وانت تجعل الحزن اذا شئت سهلا
اللهم اشرح لي صدري ويسر لي امري واحلل عقدة من لسانني يفقهوا قولي، اللهم ارحم شهداءنا في فلسطين
اللهم ارزقهم دارا خيرا من دارهم وارزقهم اهلا خيرا من اهلم وارزقهم الفردوس الاعلى من الجنة يا رب

يلا نبلش... 🔥💥

Difference between human and bacterial ribosomes

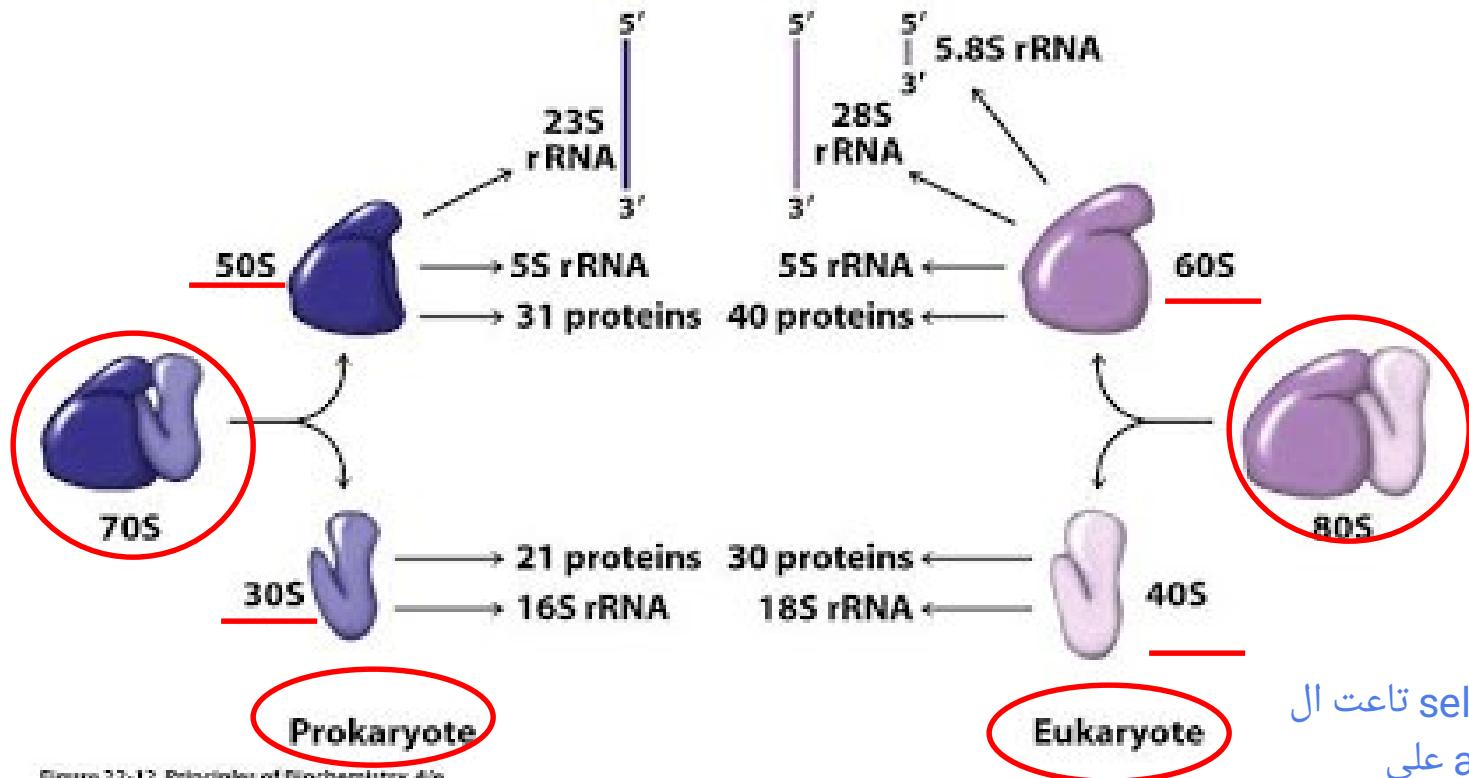

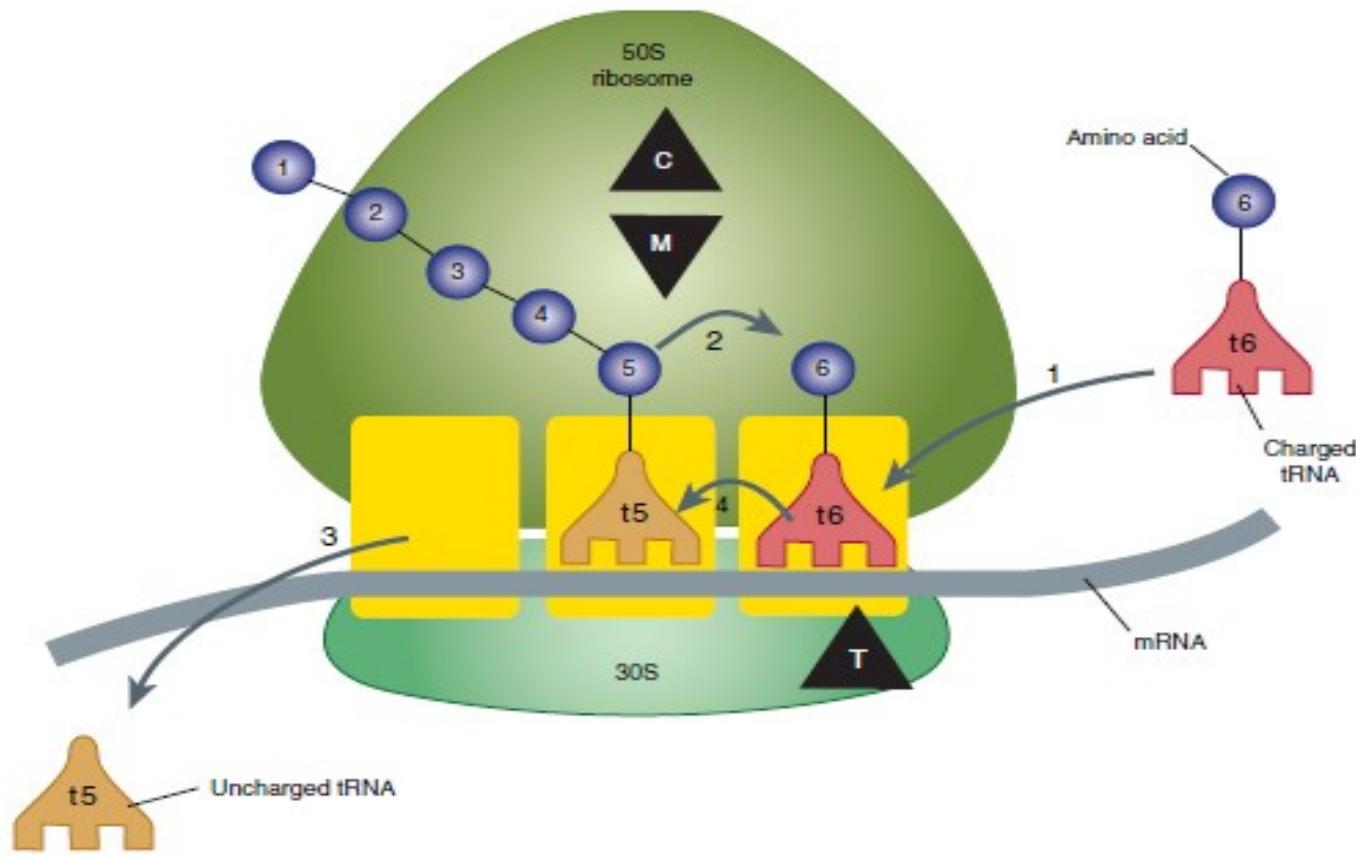

Figure 22-12 Principles of Biochemistry, 4/e
© 2006 Pearson Prentice Hall, Inc.

الـ selectivity تاعت الـ antibiotics على الـ prokaryotic (مشـ تاعت الـ eukaryotic) الـ الإنسان (مشـ تاعت الـ bacteria) الـ 5S rRNA تاعت الـ 16S rRNA

Selectivity of antibiotics on bacterial ribosomes

Protein synthesis steps

Amino acids are shown as numbered circles. In **step 1**, the charged tRNA unit carrying amino acid 6 binds to the acceptor site on the 70S ribosome (**initiation**). The peptidyl tRNA at the donor site, with amino acids 1 through 5, then binds the growing amino acid chain to amino acid 6 (**peptide bond formation or elongation, step 2**). The uncharged tRNA left at the donor site is **released (step 3)**, and the new 6-amino acid chain with its tRNA shifts to the peptidyl site (**translocation, step 4**).

عملية تصنيع البروتين بتمر بمراحل

١- يبجي عنا ال uncharged tRNA unit الي لونها احمر حامل لل amino acid خلينا نحكي ٦ عشان يسهل الشرح لقدم, ويرتبط بموقع اسمه acceptor site على الرايبوسوم 70s المرحلة هاي بنسميهها ال initiation.

٢- جنب ال acceptor site في tRNA تكون عليه donor site الحامل لل amino acid chain الي لونها اصفر الي بالاخير بده يعطياني peptide وبالاخير بده يعطياني بقوع هاض ال tRNA growing chain لل protein PEPTIDATION FORMATION OR AMINO ACID 6 (ELONGATION).

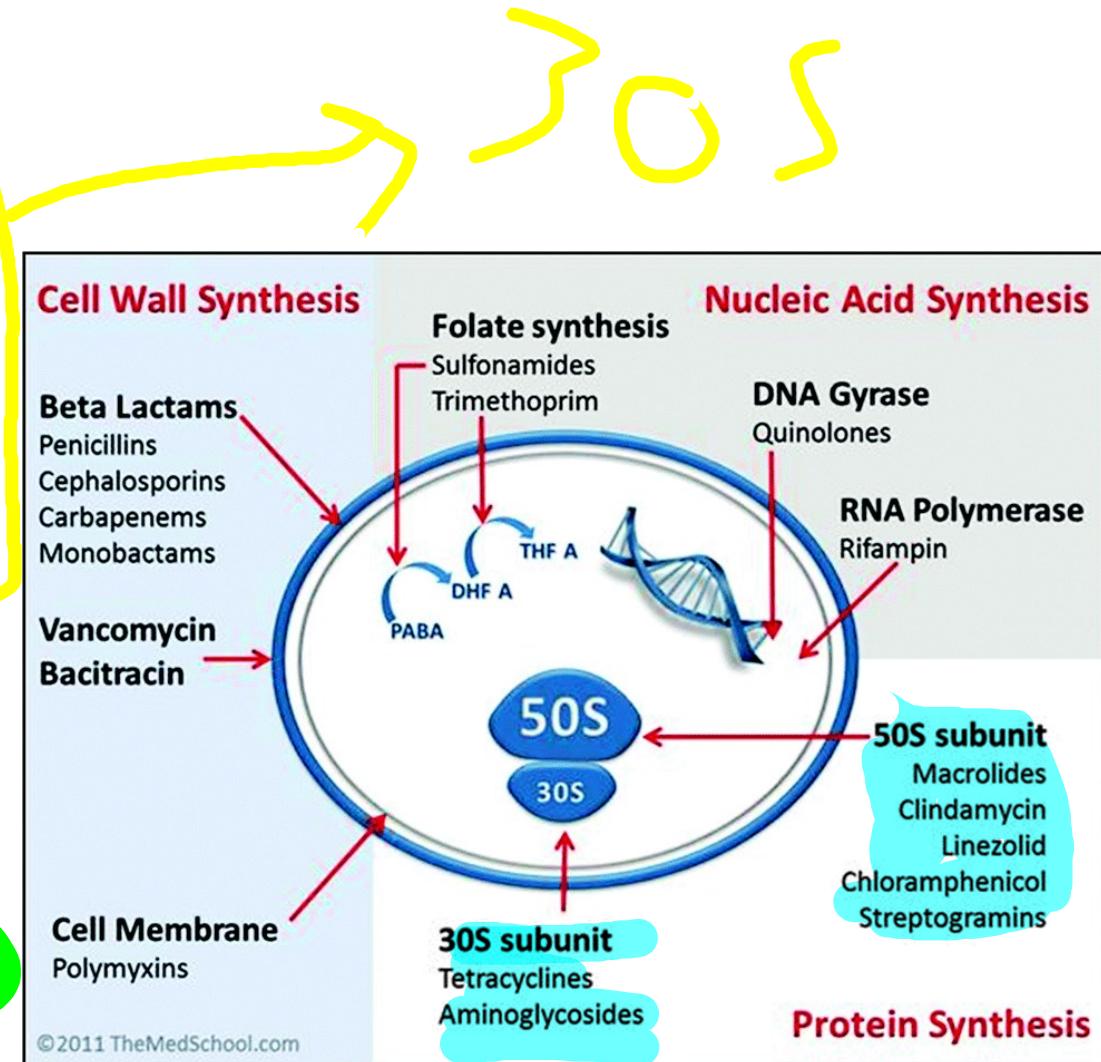

٣- ال tRNA الي كان موجود على donor site release بصيرله uncharged tRNA

٤- ال tRNA الا حمر الي كان موجود على acceptor site بيجي محل الا صفر الماضي على donor site (translocation) هاي العملية اسمها

.amino acid وبضلها تتنكر هاي العملية لحتى يعملا كل ال

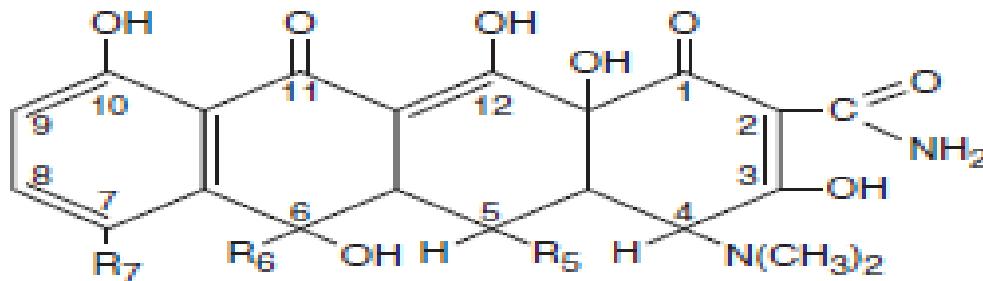

Protein synthesis inhibitors

- Tetracyclines
- Macrolides
- Clindamycin
- Chloramphenicol
- Aminoglycosides

تسمیه هیک لانه عنده cycles-4 different activity يعني different substitution .

Tetracyclines

	R₇	R₆	R₅	Renal Clearance (mL/min)
Chlortetracycline	—Cl	—CH ₃	—H	35
Oxytetracycline	—H	—CH ₃	—OH	90
Tetracycline	—H	—CH ₃	—H	65
Demeclocycline	—Cl	—H	—H	35
Methacycline	—H	—CH ₂ *	—OH	31
Doxycycline	—H	—CH ₃ *	—OH	16
Minocycline	—N(CH ₃) ₂	—H	—H	10

*There is no — OH at position 6 on methacycline and doxycycline.

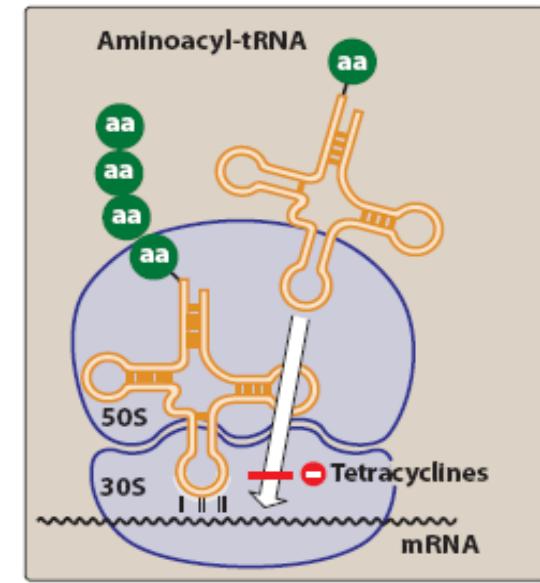

- Tetracyclines are broad-spectrum bacteriostatic antibiotics that inhibit protein synthesis.
 - Tetracyclines enter microorganisms in part by passive diffusion and in part by an energy-dependent process of active transport.
- الشغيل كله تصنيع ال protein بصير قاعد جوا ال cytosol
- من الاشياء الي سببلي resistance انه البكتيريا ما تدخل الدوا او تعمله eflux

بشكل عام ال tetracycline يمنع tRNA ال tRNA .acceptor site

Tetracyclines

- Mechanism of action:
 - binds reversibly to the 30S subunit of the bacterial ribosome
 - blocking access of the amino acyl-tRNA to the mRNA-ribosome complex at the acceptor site thus inhibiting initiation step in bacterial protein synthesis.

Step |

Tetracycline indications

- Spectrum of activity:

Broad

- A tetracycline is the drug of choice in the treatment of infections caused by rickettsiae.
- Tetracyclines are also excellent drugs for the treatment of *Mycoplasma pneumonia*, chlamydiae, and some spirochetes.
- They are used in combination regimens to treat gastric and duodenal ulcer disease caused by *Helicobacter pylori*.

الاستخدامات:

ال indication هاي مافي نوع محدد من ال tetracyclin بنسخدمه احنا بنسخدم ال tetracyclin as group يعني كلام يعني مثلاً doxycycline او minocycline.

Tetracycline indications

- ROCKY MOUNTAIN SPOTTED FEVER**

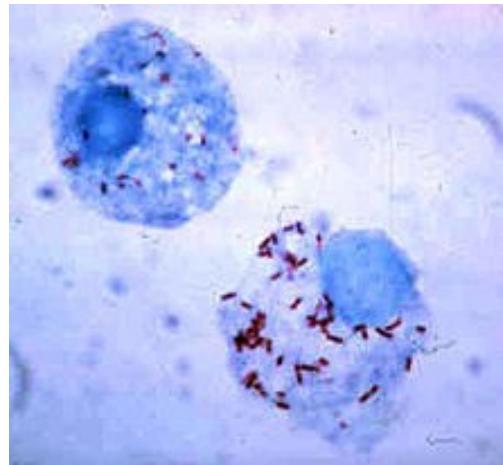

اسباب

— Caused by *Rickettsia rickettsii* (G-ve, obligate intracellular parasite)

اعراض

Characterized by fever, chills, and aches in bones and joints

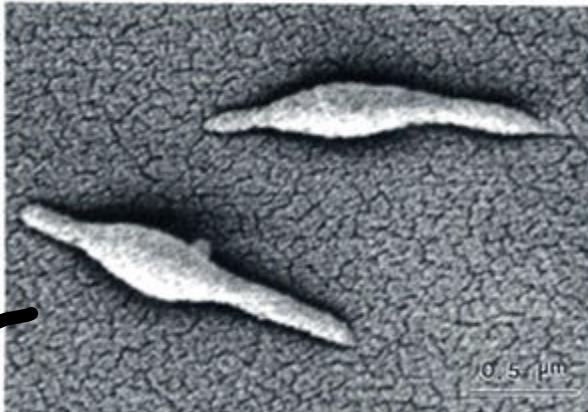

اول ما شخصوا المرض شخصوه بمنطقة اسمها rocky mountain ومن الاعراض كانت الحمة المنقطة زي الصورة تحت

Tetracycline indications

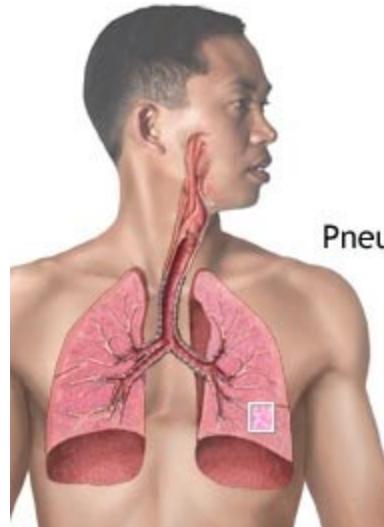

2.

MYCOPLASMA PNEUMONIAE

Is a bacterium that lacks cell wall

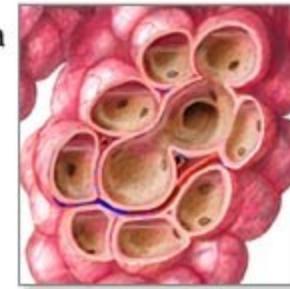

الـ mycoplasma يعني cell wall ما عندها
الادوية الي بتأثر عليه ما راح يكون لها فايدة

Normal alveoli

Pneumonia

ADAM.

Mycoplasma pneumoniae is a common cause of community acquired pneumonia

Tetracycline indications

- **LYME DISEASE**

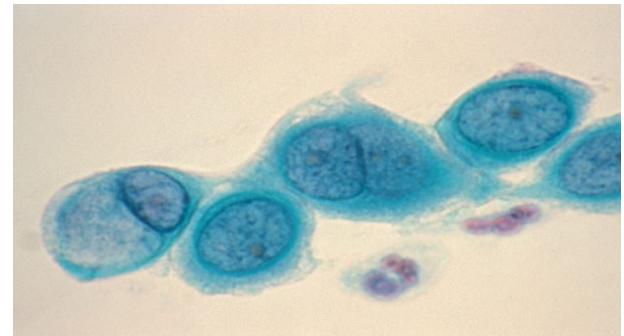

- This is a spirochetal infection caused by *Borrelia burgdorferi* (bor-dor-fry)
- Transmitted by the bite of infected ticks
- Infection results in skin lesions, pain, headache, and fever

4 Tetracycline indications

- **CHLAMYDIAL INFECTIONS** caused by:

- A. ***Chlamydia trachomatis*** :

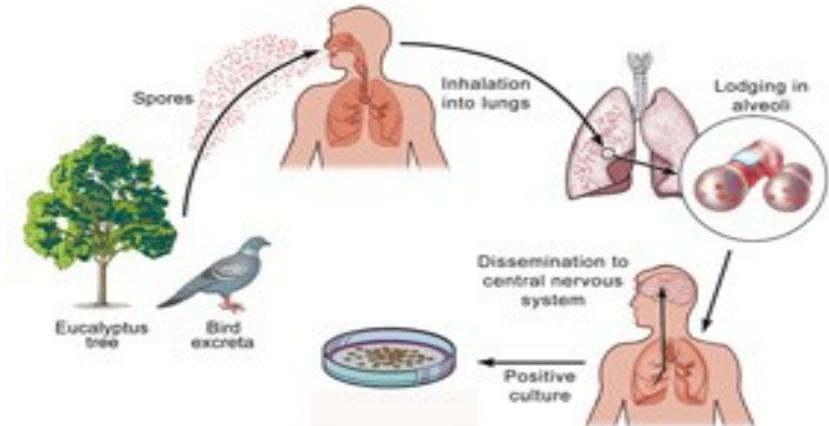

- Sexually transmitted infection
- ***Chlamydia conjunctivitis***

tetracycline ال هي سبب ال penumonia اذا chlamydia فال هو الي بمعالجها

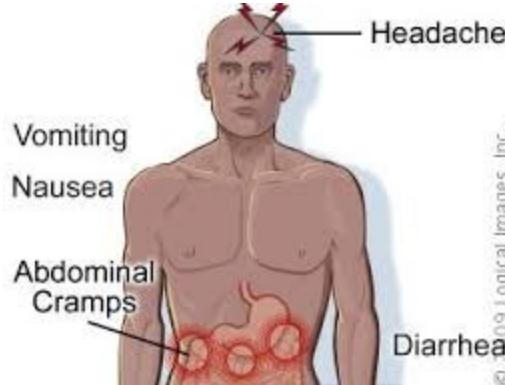

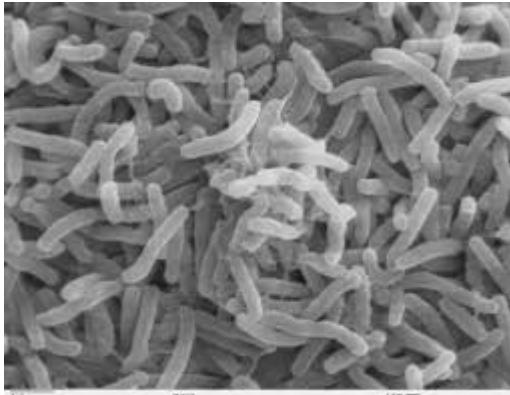

- B. ***Chlamydia psittaci* (sita-si)**

- causes **psittacosis (sitacosis)** or called **parrot disease** which usually takes the form of **pneumonia**.

Tetracycline indications

5 CHOLERA

- An infection of small intestine
- Caused by **Vibrio cholerae (G-)** ingested in fecally contaminated food or water
شخص بصير عنده vomiting , dehydration فبنقله عوض سوائل ومي كثير
- The organism multiplies in the gastrointestinal tract, where it secretes an enterotoxin that produces diarrhea and vomiting

broad

LYME DISEASE

- This is a spirochetal infection caused by *Borrelia burgdorferi*. The disease is transmitted by the bite of infected ticks.
- Infection results in skin lesions, headache, and fever, followed by meningoencephalitis and, eventually, arthritis.
- A bull's-eye pattern rash with a red outer ring, called erythema migrans is a hallmark of Lyme disease.
- Doxycycline* is one of the preferred therapeutic options.

Gram (+) cocci

Staphylococcus aureus
(including methicillin-resistant strains)
Streptococcus pneumoniae

Gram (+) bacilli

Bacillus anthracis

Gram (-) cocci

Gram (-) rods

*Brucella species**
Vibrio cholerae
Yersinia pestis

*(a tetracycline + gentamicin)

Anaerobic organisms

Clostridium perfringens
Clostridium tetani

Spirochetes

Borrelia burgdorferi
Leptospira interrogans
Treponema pallidum

Mycoplasma

Mycoplasma pneumoniae

Chlamydia

Chlamydia species

Other

Rickettsia rickettsii

CHOLERA

- Cholera is caused by *Vibrio cholerae* ingested in fecally contaminated food or water.
- The organism multiplies in the gastrointestinal tract, where it secretes an enterotoxin that produces diarrhea.
- Treatment includes *doxycycline*, which reduces the number of intestinal vibrios, and fluid replacement.

MYCOPLASMA PNEUMONIAE

- Mycoplasma pneumoniae*, or walking pneumonia, is a common cause of community-acquired pneumonia in young adults and in people who live in close confines, such as in military camps.
- Treatment with a macrolide or doxycycline is effective.

CHLAMYDIAL INFECTIONS

- Chlamydia trachomatis* is the major cause of sexually transmitted disease in the United States. It causes nongonococcal urethritis, pelvic inflammatory disease, and lymphogranuloma venereum.
- Chlamydia psittaci* causes psittacosis, which usually takes the form of pneumonia. Other clinical forms include hepatitis, myocarditis, and coma.
- Doxycycline* or *azithromycin* is used to treat chlamydial infections.

ROCKY MOUNTAIN SPOTTED FEVER

- This disease, caused by *Rickettsia rickettsii*, is characterized by fever, chills, and aches in bones and joints.
- Response to tetracyclines is prompt if the drug is started early in the disease process.

Figure 39.3

Typical therapeutic applications of tetracyclines.

مذكور هون كل الي حكيناه

Secondary uses of Tetracyclines

- Alternative drug for syphilis بدل penicillin g
- Prophylaxis against chronic bronchitis
- Treatment of moderately severe acne

أكثر استخداماته

Resistance to Tetracyclines

- Three mechanisms of resistance to tetracycline analogs have been described:

حيث عنه فوق يا اما انها بتمكن دخوله او بتخليه يطلع بشكل اكبر

- impaired influx or increased efflux by an active transport protein pump.**
- ribosome protection** due to production of proteins that interfere with tetracycline binding to the ribosome.
- enzymatic inactivation.**

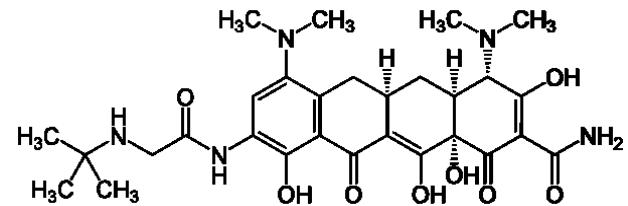

ال **rifosomes** بتغيير تعلم **modification** لحالها وتمكن ارتباط الدواء

فيها

انه الكتيريا يغير عندها انزيم يحطم نفس فكرة ال
وهاي قليلة انه البكتيريا تعملها

The most important of these are production of an efflux pump and ribosomal protection. (but not for tigecycline)

صار عنا resistance للدواء فا شو عملوا الصيادلة والعلماء اخترعوا دواء يقاومه البكتيريا الي هو ال **tigecycline** وهو عبارة عن ال **monocycline derivative** بمنع مقاومة البكتيريا لل **classic tetracycline**.

Tigecycline

الskin infection من الdrugsالي بتوصيل تركيز منيغ للجلد عشان هيڪ يستخدم لحب الشباب وال

- A newer tetracycline analog, **tigecycline**, is a glycylcycline and a semisynthetic derivative of minocycline.
- It is specifically designed to overcome tetracycline resistance, that utilize efflux pumps and/or ribosomal protection.
- It is indicated for the treatment of complicated skin and soft tissue infections, as well as complicated intra-abdominal infections (active against **MRSA**, vancomycin-resistance enterococci (**VRE**)).
- Following IV infusion, tigecycline exhibits a large volume of distribution.
- It penetrates tissues well but has low plasma concentrations. Consequently, tigecycline is a poor option for bloodstream infections.

عشنه بتوزع كوييس فالدم وهاي خاصية كويسته الا انه بضل تركيز قليل فالدم وهاض الاشي
بخليني ما استخدمنه في حال صار عندي **infection** فالدم

Pharmacokinetics

Absorption:

- Most tetracyclines are adequately absorbed after oral ingestion (Doxycycline, minocycline)
- Tigecycline is poorly absorbed orally and must be administered intravenously.
- Administration with dairy products or other substances that contain divalent and trivalent cations (for example, magnesium and aluminum antacids or iron supplements) decreases absorption due to the formation of nonabsorbable chelates.
- Tetracycline and demeclocycline should be administered on an empty stomach, while doxycycline and minocycline absorption is not impaired by food.

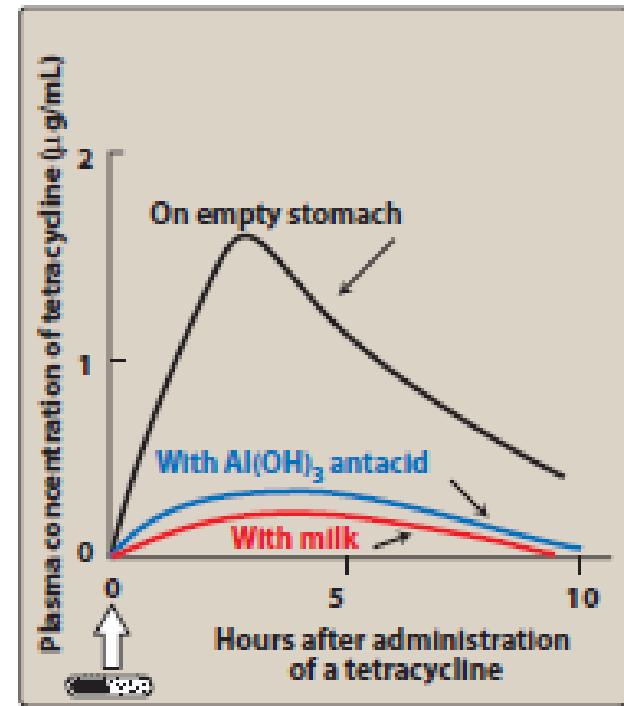

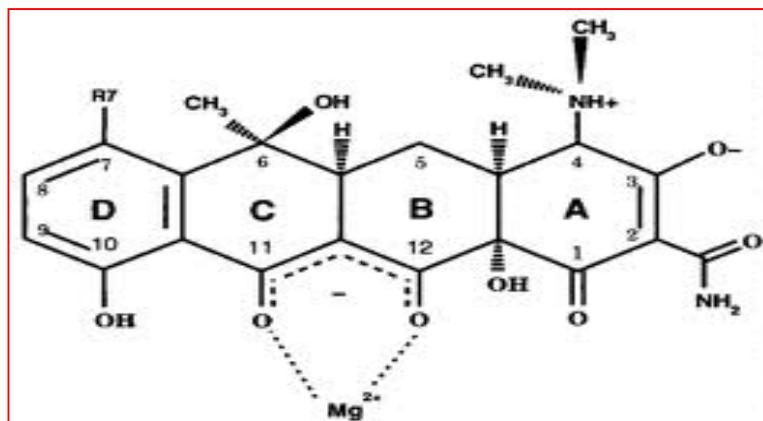

Figure 39.5
Effect of antacids and milk on the absorption of tetracyclines.

الـ monicycline و الـ doxycycline افضل امتصاص.

طول ما اتاخذوا على معدة فاضية تكون الـ افضل امتصاص.

حتى لو المريض اخذه على معدة فاضية بس اخذه مع substances او dairy products مثل divalent and trivalent cation (magnesium , aluminum antiacids or iron supplements) (magnesium , aluminum antiacids or iron supplements) بعملي chelats و يقلل الامتصاص.

من الـ adverse effects انه بضايقوا المعدة

الـ divalent or عادي لو اكلوا اكل مثلاً مما يحتوي على minocycline and doxycycline الباقي لااازم على معدة فاضية, trivalent

Distribution

- The tetracyclines concentrate in the liver, kidney, spleen, and skin (used for acne).
- Tetracyclines cross the placenta to reach the fetus. As a result of chelation with calcium, tetracyclines are bound to—and damage—growing bones and teeth and are also excreted in breast milk.
- Tetracyclines are distributed widely to tissues and body fluids except for cerebrospinal fluid (only doxycycline and minocycline enters the CSF in sufficient concentrations).

Doxycycline and minocycline achieve therapeutic concentrations in CSF

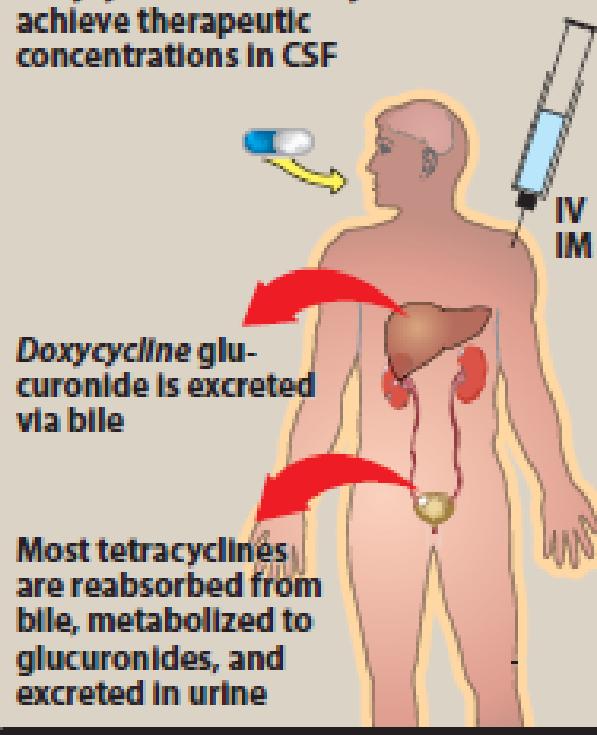

Doxycycline glucuronide is excreted via bile

Most tetracyclines are reabsorbed from bile, metabolized to glucuronides, and excreted in urine

Tetracyclines

Figure 39.4

Administration and fate of tetracyclines. CSF = cerebrospinal fluid.

ال distribution كويس الله زي ما حكينا قبل

بخترق ال placenta بوصول للعظام والاسنان فا اذا مرأة حامل اخذته الجنين اكل هوا لا مؤاخذة

.MINOCYCLINE AND DOXYCYCLINE ما بوصوله الا الدوایین هذول بالنسبة لل CSF

Elimination

- Metabolized and conjugated in the liver to form soluble glucuronides.
- Carbamazepine, phenytoin, barbiturates, and chronic alcohol ingestion may shorten the half-life of doxycycline by 50% due to induction of hepatic enzymes that metabolize the drug.
- The parent drug and/or its metabolites are secreted into the bile
- Most tetracyclines are reabsorbed via enterohepatic circulation and enter the urine by glomerular filtration
- Obstruction of the bile duct and hepatic or renal dysfunction can increase their half-lives.
- **Doxycycline and tigecycline**, in contrast to other tetracyclines, are eliminated by **nonrenal mechanisms**, do not accumulate significantly, and require no dosage adjustment in renal failure.

بلغوا بالجسم وبصيرله liver Metabolite and conjugated excretion بال urine عشان هيك بدننا functional kidney and functional liver

الا ال عشان هيك ما بحتاجوا dosage nonrenal mechanism هم doxycycline and tigecycline . renal failure في حالة ال adjustment

Adverse effects

- ✓ **Gastric discomfort** and irritation (can be controlled if the drug is taken with foods other than dairy products)

Note: *Tetracycline* should be taken on an empty stomach.

- ✓ **Effects on calcified tissues:** When a tetracycline is given during pregnancy, it can be deposited in the **fetal teeth**, leading to fluorescence, **discoloration**, and enamel dysplasia. It can also be deposited in bone, where it may cause deformity or growth inhibition. If the drug is given for long periods to children younger than 8 years, similar changes can result.
- ✓ **Hepatotoxicity:** Rarely hepatotoxicity may occur with high doses, particularly in pregnant women and those with preexisting hepatic dysfunction or renal impairment..
- ✓ Systemically administered tetracyclines, especially demeclocycline and tetracycline, can induce **sensitivity to sunlight or ultraviolet light**, particularly in fair-skinned persons. Patients should be advised to wear adequate sun protection.
- ✓ Vestibular problems (dizziness) particularly with minocycline.

Contraindications: The tetracyclines should not be used in pregnant or breast-feeding women or in children less than 8 years of age.

١- الاصل انهم يتاخدوا على معدة فاضية لكن اذا ضايقو المعدة بنوخذ معها dairy product بس هيك حيقل الامتصاص.

٢- زي ما حكينا انه بدخلوا بتركيبة العظم وبعملي discoloration,dulgd ويعملني or growth inhibition لهاض السبب ما بعطيه لمراة حامل او طفل اقل من ٨ سنين

٣- بعملي hepatotoxicity وهاض نادر لكن بعملي sensitivity to sunlight or ultraviolet عشان هيك لازم يحط sun protection light.

٤- في ناس بصير لهم dizziness خصوصا من ال minocycline

THE END
